

REACT I

APLICACIÓN. ETH TX

1. Instalar react-hook-form
2. Definir el formulario con cuenta destino e importe
3. Hacer función que haga la tx

```
const transactionParameters = {
  to: formulario.cuenta, // Required except during contract publications.
  from: ethereum.selectedAddress, // must match user's active address.
  value: ethers.utils.parseEther(formulario.importe).toHexString()
};

try {
  const txHash = await ethereum.request({
    method: 'eth_sendTransaction',
    params: [transactionParameters],
  });
  setTxOk(txHash)
} catch (error) {
  setTxRechazo(error)
}
```
